

# TALKING CROOKS IT PVT LTD

Internship Program · Task 2 · Tech / IT Track · Duration: 7 Days

## TASK 2 — Tech / IT Track

Wireframe + Use Case Document · For: Software Developers, Web Devs, UI/UX Interns

### Objective

Identify 3 real business categories where automation is lacking and software / website investment makes strong business sense. For each, build a complete wireframe / prototype showing how the solution would work — screen by screen.

### Step 1 — Choose Your 3 Use Cases (from this list or suggest your own)

- |    |                                                                                                                                                           |
|----|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 01 | <b>Clinic Management Software</b><br>Appointment booking, patient records, billing, prescription management. Most clinics still run on paper or WhatsApp. |
| 02 | <b>School / Institute ERP</b><br>Admissions, fee management, attendance, timetable, result portal. Most small institutes use manual registers.            |
| 03 | <b>Restaurant Billing &amp; Order System</b><br>Table management, digital menu, KOT (kitchen order ticket), billing, daily sales report.                  |
| 04 | <b>Real Estate CRM</b><br>Property listings, lead tracking, follow-up reminders, client communication log, document management.                           |
| 05 | <b>Retail / Inventory Management</b><br>Stock tracking, purchase orders, sales billing, low stock alerts, supplier management.                            |
| 06 | <b>Salon &amp; Spa Booking System</b><br>Online appointment booking, staff scheduling, service menu, payment tracking, customer history.                  |

You may suggest your own use case — but justify it with a one-line business reason.

### Step 2 — Build the Wireframe / Prototype

- |   |                                                                                                                                                                                         |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | <b>Understand the Business First</b><br>Visit / research 1 real business in your chosen category. Observe how they currently work. List their manual pain points.                       |
| 2 | <b>Define the Problem Statement</b><br>Write 3–5 lines: What problem does this business face? What will your software solve? Who will use it?                                           |
| 3 | <b>List the Core Screens / Modules</b><br>Example for Clinic: Login → Dashboard → Patient Records → Appointment Booking → Billing → Reports. List all screens before you start drawing. |

|   |                                                                                                                                                                                                                       |
|---|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | <b>Build the Wireframe</b><br>Use any tool: Figma (preferred), Canva, draw.io, Balsamiq, or pen & paper (photographed). Each screen must show: page title, navigation, key elements, buttons, forms, and data fields. |
| 5 | <b>Annotate Each Screen</b><br>Add short notes explaining what each element does. Example: 'This button opens the patient history panel.'                                                                             |
| 6 | <b>Write the Use Case Document</b><br>For each use case include: Problem · Target User · Key Features (minimum 5) · Business Value · Why this business would invest in this software.                                 |

## What You Will Learn

|   |                                  |
|---|----------------------------------|
| → | Real-world problem analysis      |
| → | User-centric design thinking     |
| → | Wireframing & prototyping skills |
| → | How to scope a software product  |
| → | Business value of automation     |

## Submission Checklist

|   |                                                                                         |
|---|-----------------------------------------------------------------------------------------|
| ✓ | 3 Use Cases selected — with 1-line reason why each business needs this solution         |
| ✓ | 3 Problem Statements written — one per use case, 3 to 5 lines each                      |
| ✓ | 3 Complete Wireframes — all screens annotated (Figma / tool / hand-drawn photographed)  |
| ✓ | 3 Use Case Documents — problem, target user, key features, business value               |
| ✓ | Brief video walkthrough (optional but highly recommended — 1 to 2 min screen recording) |

## Top Performer Reward

|   |                                                                                                                        |
|---|------------------------------------------------------------------------------------------------------------------------|
| ★ | <b>Top Tech Intern</b> — Best wireframe/prototype recognised publicly + certificate boost + internal appreciation post |
|---|------------------------------------------------------------------------------------------------------------------------|
