Problem Statement

Formal Problem Definition — Clinic Management Software

Talking Crooks IT Pvt Ltd

Internship Task 2 — Clinic Management Software

Prepared by: Kumar Anuj | June 2026

Document ID: CMS-D3

1. Document Overview

Document ID	CMS-D3
Project	Clinic Management Software (CMS)
Prepared By	Kumar Anuj Technical Intern, Talking Crooks IT Pvt Ltd
Date	June 2026
Version	1.0

2. Problem Statement

Context	Many small and medium-sized clinics across India still rely entirely on paper registers, manual appointment logs, and handwritten prescriptions. This practice — while familiar — is fragile, inefficient, and increasingly inadequate in a digital-first healthcare environment.
Core Problem	Apollo Clinic, like thousands of similar facilities, faces significant operational challenges stemming from the absence of a unified digital system. Appointment conflicts occur because scheduling is done verbally or on paper. Patient histories are difficult to retrieve, sometimes taking 10–15 minutes per search. Prescriptions are handwritten, introducing the risk of dispensing errors. Billing is calculated manually, leading to revenue leakage and audit difficulties. Management has no real-time visibility of daily operations.
The Gap	No single integrated tool exists within the clinic to connect patient registration, doctor scheduling, prescription management, billing, and reporting. Each function is siloed — managed by different staff using different methods — resulting in duplication, errors, and poor patient experience.
Proposed Solution	The proposed Clinic Management System (CMS) will digitise all core clinic operations: appointment booking, patient record management, doctor scheduling, prescription generation, billing and invoicing, and real-time reporting. The system will be multi-role, supporting doctors, receptionists, accountants, and clinic administrators from a single platform. It will be accessible via desktop web browser, and optionally via a mobile interface for appointment tracking.
Expected Outcome	The CMS will reduce patient waiting time, eliminate paper-based data loss, accelerate billing, improve prescription accuracy, and provide management with actionable real-time insights — ultimately improving both clinical outcomes and business profitability.

3. One-Liner Problem Statement

Many small and medium-sized clinics still rely on paper records and manual appointment management, causing inefficiencies, appointment conflicts, and difficulties in maintaining patient history. The proposed Clinic Management System will digitise appointments, patient records, prescriptions, billing, and reporting — serving doctors, receptionists, accountants, and clinic administrators from a single integrated platform.
